

## Claims

1. A retractable barrel apparatus comprising

a base;

an elongate support member having first and second ends and having a longitudinal axis, said elongate support member flexibly interconnected at said first end to said base;

5 a cover support having a substantially flat upper face, a generally circular perimeter edge, and a central axis, said cover support interconnected to said second end of said elongate support member in coaxial alignment therewith, with said upper face of said cover support generally perpendicular to said longitudinal axis of said elongate support member; and

10 a cover, formed of a flexible material, disposed on said cover support, said cover having a side wall extending around said perimeter edge of said cover support and extending therefrom toward said base in generally perpendicular relation to said upper face of said cover support, such that said wall surrounds said elongate support member.
